

Project 3 Description

Create an XML database for the records stored in "EMP" table built from the "Insert" statements in the "cretab.sql" file (refer to Project 1). In addition create a DTD that can be used to validate the table structure and the XML format (i.e., test validate the XML database, <http://xmlvalidator.newstudio.org/>). The XML document requires the following elements (others may be required also).

- **<employee>** - element that represents the entire table
- **<emprecord>** - element that represents an employee record
- **<empno>** - element representing the employee number field
- **<ename>** - element representing the employee name field
- **<empno>** - element representing the employee number field
- **<job>** - element representing the job field
- **<mgr>** - element representing the employee manager field
- **<hiredate>** - element representing the employee's hire date field
- **<sal>** - element representing the employee's salary field
- **<comm>** - element representing the employee's commission field
- **<deptno>** - element representing the employee's department number field

Save and upload the XML file, and the DTD file within a zip file Project3.zip.
